

Keven Lugo works at DPR Construction where he is dedicated to helping people build the things they care about—whether that’s constructing buildings or empowering youth to build brighter futures.

While some of the most important things we build exist outside of the physical realm, understanding the built environment is an excellent foundation. To that end, he has helped build high-end commercial office spaces in the heart of DC, pharmaceutical warehouses for private companies, cutting-edge life science

laboratories for the government, high-end ground-up office buildings in the heart of DC, and complex mechanical improvements in active data centers.

In his personal life, Keven cares about expanding educational opportunities for underserved youths. Growing up, serendipity played an influential role in his life – often manifesting in bump-ins with would-be mentors and educational opportunities presented by NGOs. Kids, independent of their socioeconomic status, are eager to learn and apply themselves. How do we increase serendipity for those kids? And once they have the right opportunities, how can we help communities empower rather than distract those kids to continue growing?
